voice pitch is correlated with high testosterone.

Altmark22 • 5 points • 14 May, 2019 03:23 PM\*

A 1% decrease in voice pitch is associated with a \$30 million increase in the size of the firm managed, and in turn, \$19 thousand more in annual compensation.

That seems frankly insane, more powerful then the effects of facial attractiveness on income in the studies I've read.

I know their incomes being much larger then medium wage ones partially accounts for this, but if this study is correct it seems voice is much more important then I thought, at least for commanding respect from men and in a social context in general.

Reading this physically hurt.
